# US-75 NORTH CENTRAL EXPRESSWAY RECONSTRUCTION: MAY 1994 TRAFFIC CONDITIONS 

by

Kevin D. Tyer<br>Assistant Research Scientist<br>Texas Transportation Institute

Research Report 1994-3
Research Study Number 7-1994
Research Study Title: Highway Planning and Operations for District 18, Phase III

Sponsored by the
Texas Department of Transportation

November 1994

TEXAS TRANSPORTATION INSTITUTE
The Texas A\&M University System
College Station, TX 77843-3135

## IMPLEMENTATION STATEMENT

This report documents the results of the May 1994 traffic data collection efforts during the fourth year of the US-75 North Central Expressway reconstruction project south of the I635 LBJ Freeway. Traffic conditions and patterns were monitored before construction in October 1989 and May 1990 and during construction each October and May since October 1990. An additional study was conducted in March 1994 to evaluate the potential traffic impacts of US-75 North Central Expressway median lane closures between McCommas and Woodall Rodgers Freeway. The traffic conditions prior to construction and during the first three and one-half years of construction were documented in previous reports. The traffic monitoring efforts involved traffic data collection and an automobile users survey. The traffic data collection included screen line traffic volume counts, vehicle occupancy and classification counts, and travel time runs. The automobile users survey results for May 1994 are documented in a separate report.

The results indicate that the US-75 North Central Expressway reconstruction project had an impact on traffic patterns in the corridor during May 1994. The lane closures in the S-2 section of the project resulted in diversion from US-75 to alternative routes in the corridor. The data collected during these studies, combined with data to be collected in subsequent studies, may be used for several potential applications:

- Traffic management planning for future phases of the North Central project and for future projects in the Dallas area.
- The development of optimal signal timing plans for the arterial streets in the corridor.
- Public affairs programs to inform the public about traffic conditions and travel alternatives.
- Dallas Area Rapid Transit (DART) bus route and schedule planning.
- Validation of portions of the North Central Texas Council of Governments (NCTCOG) peak hour traffic model.
- Validation of a traffic simulation model of the US-75 North Central Expressway corridor for evaluating proposed traffic management actions.
- 

## DISCLAIMER

The contents of this report reflect the views of the author who is responsible for the facts and the accuracy of the data presented herein. The contents do not necessarily reflect the official views or policies of the Texas Department of Transportation. This report does not constitute a standard, specification, or regulation, nor is it intended for construction, bidding, or permit purposes.

## ACKNOWLEDGMENT

The author gratefully acknowledges Diana Wallace at Texas Transportation Institute in Arlington and staff for their assistance in collecting travel time, traffic volume, and vehicle occupancy and classification data. The author wishes to thank Vincent Musat and Kevin Gee at the Texas Transportation Institute in College Station for their contributions to the data reduction and report preparation.

## SUMMARY

The results indicate that the US-75 North Central Expressway construction project during May 1994 had an effect on peak period and daily traffic conditions and travel patterns in the corridor, based upon comparisons of May 1994 versus May 1990 data. The traffic impacts likely resulted from several lane closures: the closed entrance/exit lane at Mockingbird which reduced the freeway capacity from three to two lanes in each direction, and the midday off-peak period lane closures in the S-2 section of the construction project which required the northbound lanes to be reduced from two lanes to one lane at Mockingbird. The major findings of the May 1994 traffic study are summarized as follows:

- Daily traffic volumes on US-75 North Central Expressway were an estimated 18 to 31 percent lower in May 1994 than would be expected without the project.
- The total north-south daily traffic volumes in the US-75 North Central Expressway corridor decreased four percent at the Mockingbird/Buckner screen line and increased two percent at the Oak Lawn/Lemmon/Peak screen line and four percent at the Loop 12 screen line. The decrease in total corridor volumes at the Mockingbird/Buckner screen line indicates that the construction project during May 1994 may have adversely affected trips in the corridor. The total daily traffic volumes crossing US-75 North Central Expressway dropped seven percent in westbound traffic volume and increased eight percent in eastbound volume, suggesting that the construction project may have slightly affected westbound cross-street traffic.
- The peak period and daily traffic patterns at the screen lines changed in the corridor. In general, northbound traffic volumes substantially decreased on US-75 North Central Expressway and increased on the alternative routes.
- The A.M. peak hour, peak direction (southbound) average travel times between the I635 LBJ Freeway and the Dallas central business district were 3.75 minutes lower on the US-75 North Central Expressway. Correspondingly, average travel speeds on US75 increased from $56 \mathrm{~km} / \mathrm{h}(35 \mathrm{mph})$ to $73 \mathrm{~km} / \mathrm{h}(45 \mathrm{mph})$. The P.M. peak hour, peak direction (northbound) travel times increased on US-75 by 1.25 minutes. Much larger travel time increases occurred on Preston by 9.98 minutes and US-75 Frontage Road by 5.36 minutes. P.M. peak hour, peak direction average travel speeds on US-75 slightly decreased from $39 \mathrm{~km} / \mathrm{h}$ ( 24 mph ) to $37 \mathrm{~km} / \mathrm{h}$ ( 23 mph ).

## 1. INTRODUCTION

The Texas Transportation Institute (TTI) continues to monitor the changes in corridorwide traffic conditions and travel patterns resulting from the reconstruction of the US-75 North Central Expressway south of the I-635 LBJ Freeway. The long-term construction project began during the Summer of 1990 and is expected to be completed in the late 1990s. This report documents the traffic conditions in May 1994 during the project's fourth year.

## MONITORING EFFORT

The monitoring effort closely follows the boundaries of the US-75 North Central Expressway corridor (see Figure 1.1) that were defined by the North Central Mobility Task Force:

- I-635 LBJ Freeway on the north.
- The Dallas central business district on the south.
- Audelia, Buckner, and East Grand on the east.
- The Dallas North Tollway (DNT) on the west.

TTI began monitoring the US-75 North Central Expressway corridor during October 1989 and, since that date, has been collecting data twice per year (in October and May). The monitoring effort has two major components:

- Collection of traffic data.
- Survey of automobile users.

Traffic conditions in the corridor in October 1989 and May 1990 prior to construction were documented in a previous report (1). Other reports documented the traffic conditions during the first year of construction in October 1990 and May 1991 (2), during the second year of construction in October 1991 (3) and May 1992 (4), during the third year of construction in October 1992 and May 1993 (5), and during part of the fourth year of construction in October 1993 and March 1994 (6). The results of the May 1990 through May 1994 automobile user surveys were summarized in separate reports (7-15).

FIGURE 1.1. US-75 North Central Expressway Corridor in Dallas

## PROJECT STATUS

Evaluation of traffic conditions and travel patterns observed during the May 1994 study requires knowledge regarding the construction phasing on US-75 North Central Expressway. The status of the construction project is documented in this section.

The N-1 phase of the US-75 North Central Expressway construction project was near completion in May 1994. Several lane closures occurred in the N-1 section during the midday off-peak period to perform irrigation, planter, and paving construction. In addition, the S-1 early ramp project at US-75 North Central Expressway and Woodall Rodgers interchange was completed prior to the May 1994 study.

In the S-2 phase of the project, the US-75 North Central Expressway remained twolanes in each direction between Mockingbird and McCommas (i.e., the entrance/exit ramp lane was dropped in October 1993). During the off-peak period, one lane in each direction was closed in the S-2 section to remove overhead sign structures and install glare screens and luminairs at the McCommas, Mockingbird, Yale, University, and Lovers cross streets. Construction was also ongoing on the US-75 Frontage Road in the S-1 section of the project which required Frontage Road lane closures in the off-peak period. Finally, the east approach of McCommas, the northbound US-75 Frontage Road, the west approach of Yale/SMU Blvd., and southbound US-75 Frontage Road were closed during May 1994.

## ORGANIZATION OF THE REPORT

The body of this report is divided into four chapters. Chapter 2 reviews the traffic monitoring plan used to collect and evaluate traffic conditions and travel patterns in the corridor. The observed traffic conditions during May 1994 are documented in Chapter 3. Chapter 4 summarizes the results of the May 1994 traffic study.

## 2. TRAFFIC MONITORING PLAN

The plan used to study the corridor traffic conditions and travel patterns during the reconstruction of the US-75 North Central Expressway south of the I-635 LBJ Freeway is described in this chapter. The monitoring plan encompasses two components: (1) traffic data collection and (2) automobile user survey.

## TRAFFIC DATA COLLECTION

Table 2.1 summarizes the traffic data collection in the US-75 North Central Expressway corridor. The traffic data collection consists of three elements:

- Screen line traffic volume counts.
- Vehicle occupancy and classification counts.
- Travel time runs.

Data are collected two times during the year and at the same time of the year (October and May). For comparison purposes, this report documents only data for routes that are located within the US-75 North Central Expressway corridor as defined by the Task Force. To control for seasonal variations in traffic conditions and patterns, the principal comparisons are among data collected during the same month of the year (e.g., May 1990 compared to May 1994). However, traffic volumes on US-75 North Central Expressway are seasonally adjusted so that more detailed comparisons can be made.

## Screen Line Traffic Volume Counts

Screen line traffic volume counts are used to monitor traffic patterns throughout the corridor. By definition, a screen line is a line drawn through the corridor or may be defined by a river, railroad, or other geographical barrier. Traffic volume counts are taken on each route crossing the screen line to study the trips moving through the corridor. The sum of the traffic volume counts along the screen line is the total screen line traffic volume. Changes in traffic patterns are measured as changes in individual routes' percentage of the total screen line traffic volume and differences in actual traffic volumes.

|  |  | Roynl |  |  |  | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ | $\bullet$ |  | $\bullet$ |

Traffic patterns are being observed at four screen lines, which are designated by the routes which the screen lines follow:

- Oak Lawn/Lemmon/Peak.
- Mockingbird/Buckner.
- Loop 12.
- US-75 North Central Expressway.

Three screen lines (Oak Lawn/Lemmon/Peak, Mockingbird/Buckner, and Loop 12) identify changes in traffic patterns on north-south routes. The US-75 screen line, which bisects the Expressway, was established to measure changes in east-west traffic patterns. Figure 2.1 identifies the count locations for the May 1994 traffic study.

In October 1989, traffic patterns were monitored only at the screen line south of Mockingbird/Buckner. The May 1990 study, the principal data collection effort before construction, included all four screen lines. The October 1990 study, the first data collection effort during construction, focused on the northern half of the corridor which would be most affected by the construction activities that were underway at the time on the $\mathrm{N}-1$ and $\mathrm{N}-2$ phases of the US-75 North Central Expressway project. Studies since May 1991 closely resemble the May 1990 (before construction) data collection effort.

Directional 24-hour traffic volumes are collected for at least one mid-week day (i.e., Tuesday, Wednesday, and Thursday) at the screen line count locations during the study period. Volumes are averaged to represent mid-week traffic conditions. The traffic volume data collection uses several methods:

- Pneumatic tube counters to collect traffic volumes on arterial streets.
- Video camera and time-lapse video tape recorder to record traffic on US-75.
- Toll booth data to estimate traffic volumes on Dallas North Tollway.

Automatic Traffic Recorder (ATR) stations in the Dallas metropolitan area that are not affected by the project were selected as control locations to better estimate the volume changes on the US-75 North Central Expressway that are attributable to the construction project. The ATR locations are shown in Figure 2.2. The seasonal patterns on US-75 before construction

- May 1994

## Volume Occupancy/Classification

- May 1994

FIGURE 2.1. US-75 North Central Expressway Corridor Traffic Volume and Vehicle Occupancy and Classification Count Locations

FIGURE 2.2. Automatic Traffic Recorder (ATR) Stations Selected for Control Locations in Dallas
have been shown in past studies to be comparable to those patterns on other freeways in the Dallas area. Daily traffic volumes are obtained from the ATR stations to investigate the traffic volume trends in the Dallas area as compared to those on US-75 during construction. The ATR volume data are used to estimate the traffic volume on US-75 that normally would have been observed in the absence of the construction project. This method allows the impacts of the construction project to be isolated from normal daily and seasonal variations in traffic volumes.

## Vehicle Occupancy and Classification Counts

Vehicle occupancy and classification data are collected on the US-75 main lanes north of the Mockingbird/Buckner screen line during each study. The count location is identified in Figure 2.1.

Vehicles are grouped into four categories: passenger vehicles, commercial vehicles, buses, and motorcycles. Passenger vehicles include all cars as well as all pickup trucks and vans that have no commercial identification.

## Travel Time Runs

Travel times and speeds are monitored on major north-south routes in the corridor and several east-west routes that traverse across the corridor. All north-south routes extend between I-635 LBJ Freeway and the Dallas central business district. East-west routes coincide with the east-west screen lines.

Table 2.2 provides a summary of the travel time routes and the number of travel time run repetitions on each route during the monitoring studies. The street name appearing in bold-face type represents the major street on each route and is used to designate the route. Figure 2.3 identifies the routes monitored during May 1994.

Travel time data are collected using the floating car technique in which the driver of the test vehicle approximates the median speed of the traffic stream by passing as many vehicles as pass the driver. Data collection vehicles start at each end of the route at half-hour

FIGURE 2.3. Travel Time Routes
intervals from 6:00 to 9:00 A.M. and 3:00 to 7:00 P.M. Travel times on US-75 are also collected between 9:00 A.M. and 2:00 P.M. Travel times are measured between each pair of signalized cross streets and for the entire route. Stopped delays are also recorded at the signalized intersections. In order to compute average travel speeds, the distance between each signalized intersection was measured using a vehicle-installed distance measuring instrument. Peak hour average travel times and average travel speeds are computed for the A.M. peak using the 7:00, 7:30, and 8:00 A.M. travel time runs and for the P.M. peak using the 5:00, 5:30, and 6:00 P.M. runs.

## AUTOMOBILE USER SURVEY

Biannual surveys of automobile users in the US-75 North Central Expressway corridor are conducted as part of the traffic monitoring studies. The role of the surveys in the overall monitoring effort is to obtain information on the perceptions and travel behavior of individual automobile users in the corridor as well as current public opinion regarding the reconstruction project. Periodically surveying the panel members permits changes in perceptions and behavior to be monitored. Details of the surveying effort and results were documented in other reports (7-15).

Original panel members (i.e., automobile users who agreed to be surveyed biannually) were recruited from a license plate study conducted during May 1990 at the Loop 12 screen line. The most recent panel of automobile users originated from a license plate survey performed at the Oak Lawn/Lemmon/Peak screen line in October 1992. This new panel was recruited to increase the number of survey participants. The original panel and the new panel were surveyed in May 1994.

## 3. MAY 1994 TRAFFIC CONDITIONS

The traffic conditions observed during May 1994, almost four years after the US-75 North Central Expressway reconstruction project began, are documented in this chapter. Traffic conditions are reported as changes in traffic patterns, vehicle occupancy and classification, and travel times and average travel speeds. May 1994 traffic volume and travel time data are summarized in Appendices A through E.

## SCREEN LINE TRAFFIC VOLUMES

Summaries of the screen line traffic volume counts are presented in Appendices A, B, and C. Appendix A contains tables summarizing the hourly volume counts on each route at each screen line. Appendix B contains figures that summarize each route's percentage of the total screen line volume; individual figures are presented for each of four screen lines and each of three time periods: A.M. peak (6:00-9:00 A.M.), P.M. peak (3:00-7:00 P.M.), and 24 hours. Appendix C contains similar figures summarizing the actual change in volumes on each route between the May studies.

Screen line traffic volumes were evaluated for three time periods (A.M. peak, P.M. peak, and 24 hours) and were compared only for the May studies. Comparisons primarily consist of changes between May 1990 (before construction) and May 1994 data. The evaluation of US-75 traffic volumes, however, compares both October and May data to better estimate the traffic impacts of the project.

Table 3.1 summarizes the total corridor traffic volumes at each screen line for May 1994 compared to May 1990. The total 24-hour north-south traffic volumes decreased four percent at the Mockingbird/Buckner screen line, and increased two percent at the Oak Lawn/Lemmon/Peak screen line and four percent at the Loop 12 screen line. The total 24hour east-west traffic volume crossing the US-75 screen line changed very little, although by direction the eastbound traffic volume increased eight percent and the westbound volume decreased seven percent.

The corridor-wide traffic patterns and traffic volume changes are presented for the north-south and east-west routes separately. An analysis of US-75 traffic volumes including comparisons to control locations in the Dallas area is also provided.

TABLE 3.1. US-75 North Central Expressway Corridor Traffic Volumes During May 1994

|  |  | Total | 420,380 | 421,270 | 890 | 0.21 |

## Traffic Patterns on North-South Routes

The north-south traffic patterns observed during May 1994 at the Oak Lawn/Lemmon/Peak, Mockingbird/Buckner, and Loop 12 screen lines fluctuated more in the northbound direction than in the southbound direction. The observed northbound daily traffic volumes on US-75 at the three screen lines were between 18 and 36 percent lower in May 1994 than in May 1990. The largest reductions in peak period, peak direction traffic volumes on US-75 occurred in the northbound direction during the P.M. peak period. Though not as large, changes were also observed in the southbound direction. Depending on the screen line, traffic increases occurred on alternative routes including DNT, Lemmon, Oak Lawn, Preston, Cole, McKinney, Hillcrest, Ross, Live Oak, Greenville, Matilda, Skillman, and Abrams. These changes signify possible diversion from US-75 to other routes in the corridor.

The drop in traffic volumes on US-75 North Central Expressway may have been due to the construction underway in May 1994. The number of lanes at Mockingbird, where the largest volume decrease was observed, has been reduced from three to two lanes in each direction during construction (i.e., the entrance/exit ramp lane has been removed). The construction in the $\mathrm{S}-2$ section required the northbound main lanes at Mockingbird to be reduced from two lanes to one lane during the midday off-peak period. These lane closures resulted in diversion from US-75 North Central Expressway to alternative routes.

## Oak Lawn/Lemmon/Peak Screen Line

The Oak Lawn/Lemmon/Peak screen line traffic distribution show that fluctuations in each route's percentage of total screen line traffic volume were as much as eight percent between May 1990 and May 1994 (see Figures B. 1 through B.3). In May 1994, US-75 did not carry the majority of the peak period, peak direction traffic (see Figures B.1, b and B.2, a). Instead, DNT had the largest peak period, peak direction traffic volume in the corridor. Some deviations were observed in the May 1994 peak period, off-peak direction traffic patterns, but US-75 continued to have the largest volume along the screen line (see Figures B.1, a and B.2, b). Despite the changes in peak period traffic patterns, US-75 carried most (i.e., 27 percent) of the daily traffic volumes across the corridor (see Figure B.3). Traffic volumes generally decreased on US-75 and increased on most alternative routes (see Figures C. 1 through C.3).

## Mockingbird/Buckner Screen Line

The fluctuations in each route's percentage of the total screen line traffic at the Mockingbird/Buckner screen line were as much as nine percent between May 1990 and May 1994 (see Figures B. 4 through B.6). US-75 no longer had the highest peak period, peak direction (northbound) traffic volume in May 1994 (see Figure B.5, a). Instead, DNT carried the majority of the traffic volume in the corridor. A substantial decrease in peak period and daily traffic volumes occurred on US-75 while volumes generally increased on other routes in the corridor (see Figures C. 4 through C.6).

## Loop 12 Screen Line

The traffic patterns at the Loop 12 screen line show fluctuations as large as eight percent in each route's percentage of total screen line traffic volume between May 1990 and May 1994 (see Figures B. 7 through B.9). DNT carried the majority of the north-south peak period, peak direction traffic crossing the screen line. However, the traffic distribution indicates that US-75 had the highest percentage of total screen line traffic volume for the 24hour period. Northbound volumes were lower on US-75 and higher on alternative routes (see Figures C. 7 through C.9).

## Traffic Patterns on East-West Routes

Traffic crosses US-75 North Central Expressway on eighteen routes between the I-635 LBJ Freeway and the Woodall Rodgers Freeway. The traffic distribution along the US-75 screen line show that the cross-street route's percentage of total screen line volume fluctuated by as much as nine percent between May 1990 and May 1994 (see Figures B. 10 through B.12). Westbound traffic volumes generally decreased on McCommas, Mockingbird, Yale, University, Lovers, Southwestern, and Caruth Haven (see Figures C. 10 through C.12). In addition, traffic on Walnut Hill substantially increased in the eastbound direction.

## Traffic Patterns on US-75 North Central Expressway

The daily traffic volume on US-75 North Central Expressway at the three screen line count locations from October 1989 to May 1994 and the corresponding average Automatic Traffic Recorder (ATR) traffic volumes for the Dallas area are shown in Figure 3.1. The US75 traffic patterns generally follow the trends at control locations in the Dallas area before construction. Prior to October 1991, other than the normal variation in traffic volumes due to seasonal patterns, the total traffic on US-75 during construction had not changed significantly. Since October 1991, the volume trend lines have deviated from ATR trends. The daily traffic volume on US-75 at Lemmon continues to decrease. Daily volume at Mockingbird significantly dropped in May 1994. The traffic volume at Loop 12 was lower in May 1994 than previous May data.

The US-75 North Central Expressway daily traffic volumes at the three screen line count locations in May 1994 compared to seasonally adjusted before construction volumes are summarized in Table 3.2. The changes in US-75 traffic volumes were an estimated reduction of 21 percent at Lemmon, 31 percent at Mockingbird, and 18 percent at Loop 12. Thus, the US-75 daily traffic volumes were much lower in May 1994 than volumes that would have been expected in the absence of the construction project.

## VEHICLE OCCUPANCY AND CLASSIFICATION

Table 3.3 summarizes the average occupancy of passenger vehicles on the US-75 North Central Expressway for the May studies. The occupancy data indicate that the average passenger vehicle occupancy is lower in the A.M. peak period than in the P.M. peak period, and also that the peak period, peak direction traffic has a lower vehicle occupancy than the off-peak direction traffic. The May 1994 A.M. peak period, peak direction data show an average occupancy of 1.11 persons per passenger vehicle with 90 percent of the passenger vehicles carrying one person; 9 percent, two persons; and 1 percent, more than two persons. During the P.M. peak period, the peak direction average passenger vehicle occupancy was 1.23 persons per vehicle with 81 percent of the passenger vehicles being single-occupant vehicles; 16 percent carrying two persons; and 3 percent having more than two persons. The average number of occupants per passenger vehicle has not changed significantly during construction. The majority of the automobile users on US-75 North Central Expressway continue to drive alone.

FIGURE 3.1. Daily Traffic Volumes on US-75 Compared to ATR Stations in the Dallas Area from October 1989 to May 1994

TABLE 3.2. Changes in Daily Traffic Volumes on US-75 During May 1994

| Screen Line Count Location | Direction | Daily Traffic Volumes |  |  |  |  |

|  | Total | 128,777 | 144,240 | 118,500 | -25,740 | -17.85 |

[^0]TABLE 3.3. Average Passenger Vehicle Occupancy on US-75 (May Studies)

| Time <br> Period | Direction |  | Average Occupancy (persons/vehicle) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | May 1990 | May 1991 | May 1992 | May 1993 | May 1994 |  |
| A.M. Peak | Northbound | 1.23 | 1.14 | 1.23 | 1.22 | 1.21 |  |
|  | Southbound | 1.19 | 1.08 | 1.11 | 1.11 | 1.11 |  |
|  | Both | 1.20 | 1.11 | 1.16 | 1.16 | 1.16 |  |
| P.M. Peak | Northbound | 1.19 | 1.16 | 1.22 | 1.21 | 1.23 |  |
|  | Southbound | 1.28 | 1.18 | 1.29 | 1.30 | 1.27 |  |
|  | Both | 1.22 | 1.17 | 1.25 | 1.26 | 1.25 |  |

Note: Peak period, peak direction data are shown in boldface.

The vehicle classification data are summarized in Table 3.4. In May 1994, the peak period, peak direction vehicle mix on US-75 averaged 94-95 percent passenger vehicles, 4-5 percent commercial trucks, and 1 percent other (bus and motorcycle). The vehicle mix in the peak period, peak direction traffic was similar to previous studies.

## TRAVEL TIMES AND AVERAGE TRAVEL SPEEDS

Travel times and speeds collected during May 1994 are summarized in tabular form in Appendices D and E. Appendix D contains tables summarizing the peak period, peak, and off-peak direction travel times for nine north-south routes in the corridor. In addition, peak period travel times for four east-west routes and off-peak period travel times on US-75 North Central Expressway are presented. Appendix E contains tables summarizing the corresponding average travel speeds.

The peak period and peak hour travel time and speed results are presented for the north-south and east-west routes separately. US-75 North Central Expressway travel times and speeds are then presented in more detail.

## North-South Routes

The peak period average travel times and speeds on the north-south routes between I635 and the central business district are given in Table 3.5. Of the nine routes, US-75 had the lowest peak period, peak direction average travel time of 12.37 minutes, while Preston had the highest average travel time of 33.49 minutes. Because the travel distances vary between $\mathrm{I}-635$ and the central business district, the average travel speed is considered a better measure to compare the different routes. The highest peak period, peak direction average travel speed, approximately $78 \mathrm{~km} / \mathrm{h}(48 \mathrm{mph})$, was observed on DNT, while the lowest average travel speed, $29 \mathrm{~km} / \mathrm{h}(18 \mathrm{mph})$, was on Preston.

The peak hour average travel times and travel speeds in the peak direction for the May studies are shown in Figures 3.2 and 3.3. As the figures illustrate, peak hour travel times and speeds have fluctuated over the years to some degree. It appears that some changes occurred during May 1994.

TABLE 3.4. Vehicle Classification on US-75 (May Studies)

| Time Period | Vehicle Type | Percent of Vehicles |  |  |  |  |  |  |  |  |  |

(b) P.M. Peak

FIGURE 3.2. Average Peak Hour, Peak Direction Travel Times
Between I-635 and Central Business District (May Studies)

(a) A.M. Peak

(b) P.M. Peak

FIGURE 3.3. Average Peak Hour, Peak Direction Travel Speeds
Between I-635 and Central Business District (May Studies)
A.M. peak hour, peak direction (southbound) average travel times in May 1994 were higher on Preston ( 3.20 minute increase), Abrams ( 2.15 minute increase), and Garland ( 2.76 minute increase) compared to May 1990 before construction began. Average travel times during the A.M. peak hour were lower on DNT ( 2.37 minute decrease), US-75 ( 3.75 minute decrease), Greenville ( 2.72 minute decrease), and Skillman ( 2.42 minute decrease). The large 10.46 minute reduction in travel times on the US-75 Frontage Road is probably due to higher than normal May 1990 travel times that resulted from incidents. The average travel time on the US-75 Frontage Road, however, was lower than previous studies. In the P.M. peak hour, peak direction (northbound), average travel times increased on Preston ( 9.98 minutes), US-75 ( 1.25 minutes), US-75 Frontage Road ( 5.36 minutes), and Greenville ( 1.26 minutes). Reductions occurred on Skillman (1.16 minute), Abrams (4.00 minute), and Garland (1.91 minute).

Similar results were found in the peak hour, peak direction average travel speeds. In the A.M. peak hour, the US-75 average travel speed increased from $56 \mathrm{~km} / \mathrm{h}$ ( 35 mph ) in May 1990 to $73 \mathrm{~km} / \mathrm{h}(45 \mathrm{mph})$ in May 1994. P.M. peak hour average travel speeds slightly decreased on US- 75 from $39 \mathrm{~km} / \mathrm{h}(24 \mathrm{mph}$ ) to $37 \mathrm{~km} / \mathrm{h}$ ( 23 mph ).

## East-West Routes

Table 3.6 summarizes the peak period average travel times and speeds for the east-west routes. Of the four east-west routes monitored, Mockingbird had the lowest average travel speed in both directions. These May 1994 travel times and speeds appear to be similar to those collected in previous studies.

## US-75 North Central Expressway

The travel times and average travel speeds on US-75 from 6:00 A.M. to 7:00 P.M. are illustrated in Figures 3.4 and 3.5. The May 1994 data are shown relative to other May studies. In addition to peak period, peak direction conditions, these plots provide insight into the off-peak direction and off-peak period travel times and speeds. The northbound travel times and speeds in May 1994 were higher than in other May studies. The northbound offpeak period travel times were much longer than previous data. These results suggest that the

FIGURE 3.5. Average Travel Speed on US-75 Between I-635 and Central Business District (May Studies)
lane closures during the off-peak period adversely affected travel times on US-75. The southbound values indicate that the travel times during the A.M. and P.M. peak periods were lower than observed during earlier studies. The off-peak period travel times in the southbound direction were only slightly higher. Correspondingly, northbound average travel speeds were lower than found in previous studies. The southbound average travel speeds were generally higher in May 1994. The results suggest that the construction underway south of Mockingbird during May 1994 may have affected US-75 northbound travel while southbound traffic conditions generally improved.

## 4. SUMMARY

This chapter summarizes the results of the May 1994 traffic monitoring effort. The study evaluated the traffic impacts of the construction project on traffic conditions and travel patterns throughout the corridor, based upon comparisons of May 1994 versus May 1990 data.

The results indicate that the US-75 North Central Expressway construction project during May 1994 had an effect on peak period and daily traffic conditions and travel patterns in the corridor. The change in traffic volumes likely resulted from several lane closures: the closed entrance/exit lane at Mockingbird which reduced the freeway capacity from three to two lanes in each direction, and the midday off-peak period lane closures in the S-2 section of the construction project which required the northbound lanes to be reduced from two lanes to one lane at Mockingbird. The major findings of the May 1994 traffic study are summarized as follows:

- Daily traffic volumes on US-75 North Central Expressway were an estimated 18 to 31 percent lower in May 1994 than would be expected in the absence of the construction project.
- The total north-south daily traffic volumes in the US-75 North Central Expressway corridor decreased four percent at the Mockingbird/Buckner screen line, and increased two percent at the Oak Lawn/Lemmon/Peak screen line and four percent at the Loop 12 screen line. The decrease in total corridor volumes at the Mockingbird/Buckner screen line indicates that the construction project during May 1994 may have adversely affected trips in the corridor. The total daily traffic volumes crossing US-75 North Central Expressway dropped seven percent in westbound traffic volume and increased eight percent in eastbound volume, suggesting that the construction project may have slightly affected westbound cross-street traffic.
- The peak period and daily traffic patterns at the screen lines changed in the corridor, primarily in the northbound direction. In general, northbound traffic volumes substantially decreased on US-75 North Central Expressway and increased on the alternative routes.
- Peak period, peak direction traffic on US-75 North Central Expressway consists of 94-95 percent passenger vehicles, 4-5 percent commercial trucks, and 1 percent other (bus and motorcycle). Of the passenger vehicles, 81 to 90 percent carried one person; 9 to 16 percent, two persons; and 1 to 3 percent, more than two persons. The peak direction average passenger vehicle occupancy ranged from 1.11 to 1.23 . The majority of the automobile users on US-75 North Central Expressway continue to travel alone.
- The A.M. peak hour, peak direction (southbound) average travel times between the I-635 LBJ Freeway and the Dallas central business district were 3.75 minutes lower on the US-75 North Central Expressway. Correspondingly, average travel speeds on US-75 increased from $56 \mathrm{~km} / \mathrm{h}(35 \mathrm{mph})$ to $73 \mathrm{~km} / \mathrm{h}(45 \mathrm{mph})$. Other reductions in travel time were observed on DNT, Skillman, and Greenville ranging from 2.37 to 2.72 minutes. The P.M. peak hour, peak direction (northbound) travel times increased on US-75 North Central Expressway by 1.25 minutes. Much larger travel time increases occurred on Preston by 9.98 minutes and US-75 Frontage Road by 5.36 minutes. P.M. peak hour, peak direction average travel speeds slightly decreased on US-75 from $39 \mathrm{~km} / \mathrm{h}(24 \mathrm{mph})$ to $37 \mathrm{~km} / \mathrm{h}(23 \mathrm{mph})$.

TABLE A.8, US-75 Screen Line Average Traffic Volumes (May 1994): Westbound

## APPENDIX B

SCREEN LINE TRAFFIC VOLUMES (MAY STUDIES): PERCENTAGE OF TOTAL SCREEN LINE VOLUME BY ROUTE

FIGURE B.I. Percent of Total Screen Line Volume by Route:
Oak Lawn/Lemmon/Peak - A.M. Peak Period (May Studies)

FIGURE B.2. Percent of Total Screen Line Volume by Route:
Oak Lawn/Lemmon/Peak - P.M. Peak Period (May Studies)

a) Northbound
b) Southbound

FIGURE B.3. Percent of Total Screen Line Volume by Route: Oak Lawn/Lemmon/Peak - 24 Hour Period (May Studies)

FIGURE B.4. Percent of Total Screen Line Volume by Route:
Mockingbird/Buckner - A.M. Peak Period (May Studies)

FIGURE B.5. Percent of Total Screen Line Volume by Route:
Mockingbird/Buckner - P.M. Peak Period (May Studies)

a) Northbound
b) Souhbound

FIGURE B.6. Percent of Total Screen Line Volume by Route:
Mockingbird/Buckner-24 Hour Period (May Studies)

FIGURE B.7. Percent of Total Screen Line Volume by Route: Loop 12 - A.M. Peak Period (May Studies)

a) Northbound

FIGURE B.8. Percent of Total Screen Line Volume by Route: Loop 12 - P.M. Peak Period (May Studies)

b) Southbound

FIGURE B.9. Percent of Total Screen Line Volume by Route:
Loop 12-24 Hour Period (May Studies)

a) Eastbound

b) Wessbound

FIGURE B.11. Percent of Total Screen Line Volume by Route: US-75-P.M. Peak Period (May Studies)

FIGURE B.12. Percent of Total Screen Line Volume by Route:
US-75-24 Hour Period (May Studies)

## APPENDIX C

## TRAFFIC VOLUME CHANGES (MAY STUDIES)

b) Southbound

FIGURE C.1. Change in Volume by Route as Compared to May 1990: Oak Lawn/Lemmon/Peak Screen Line - A.M. Peak Period

a) Northbound

b) Southbound

FIGURE C.2. Change in Volume by Route as Compared to May 1990: Oak Lawn/Lemmon/Peak Screen Line - P.M. Peak Period

FIGURE C.3. Change in Volume by Route as Compared to May 1990: Oak Lawn/Lemmon/Peak Screen Line - 24 Hour Period

FIGURE C.4. Change in Volume by Route as Compared to May 1990: Mockingbird/Buckner Screen Line - A.M. Peak Period

FIGURE C.5. Change in Volume by Route as Compared to May 1990: Mockingbird/Buckner Screen Line - P.M. Peak Period

a) Noithbound

b) Southbound

FIGURE C.6. Change in Volume by Route as Compared to May 1990: Mockingbird/Buckner Screen Line - $\mathbf{2 4}$ Hour Period

b) Southbound

FIGURE C.7. Change in Volume by Route as Compared to May 1990: Loop 12 Screen Line - A.M. Peak Period

FIGURE C.8. Change in Volume by Route as Compared to May 1990:
Loop 12 Screen Line - P.M. Peak Period

FIGURE C.9. Change in Volume by Route as Compared to May 1990:
Loop 12 Screen Line - 24 Hour Period

FIGURE C.11. Change in Volume by Route as Compared to May 1990: US-75 Screen Line - P.M. Peak Period
C-1.3

FIGURE C.12. Change in Volume by Route as Compared to May 1990: US-75 Screen Line - 24 Hour Period

## APPENDIX D

## MAY 1994 TRAVEL TIMES
